## Mediterranean Coastal Wave Forecasting System (MC\_WAF)

### Outlines:

#### Coastal Wave Forecast

- implementation
- operational system
- system preliminary evaluation
- next steps

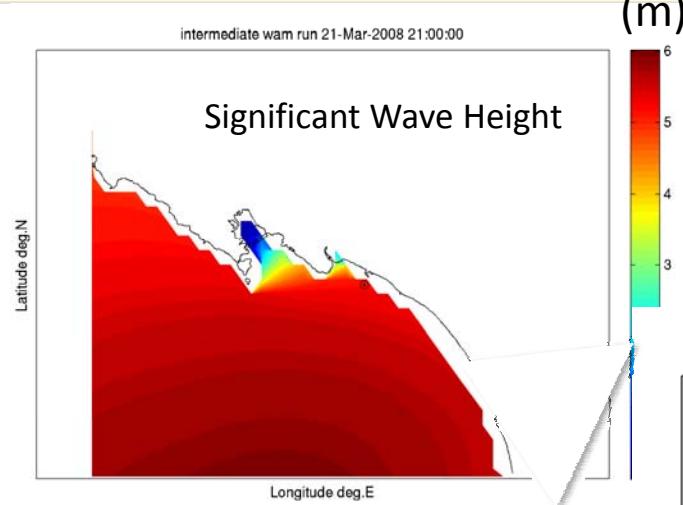

**Applications of the coastal system:** coastal dynamics, erosion, coastal engineering, marine biology

Example:

The wave energy flux produced by the coastal model are used to analyse the images taken by high resolution cameras in order to determine the evolution of the small scale variations of the bathymetry (seasonally or after some significant storm).

*Courtesy of dr. Luca Parlagreco and the Climate Change and Coastal Study Unit of ISPRA*

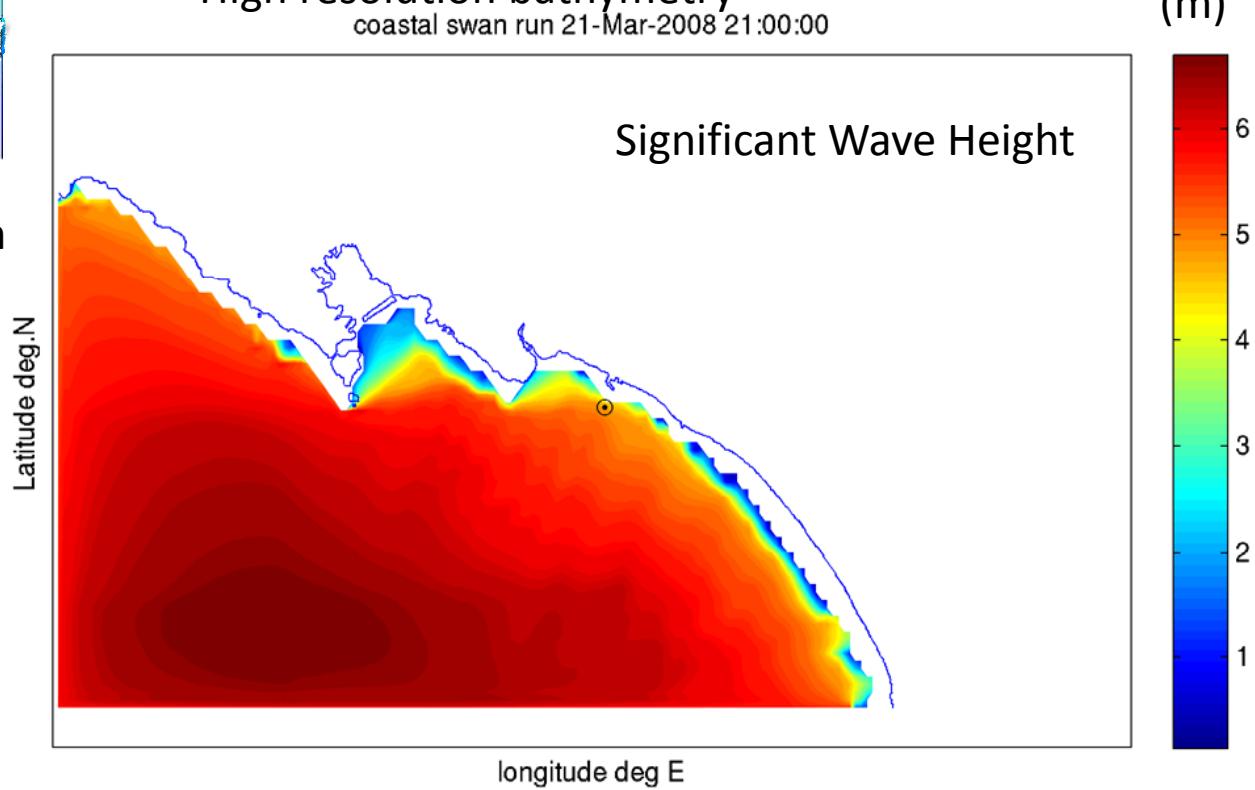

Wave Model (Regional scale) run without bottom dissipation and breaking, coarse bathymetry

WAM at the Mediterranean scale makes good use of the wind from meteorological models, can take into account currents from ocean models and can assimilate satellite data

Local scale (coastal) SWAN model needs boundary forcing provided by a Regional model

SWAN run with bottom dissipation and breaking  
High resolution bathymetry

coastal swan run 21-Mar-2008 21:00:00

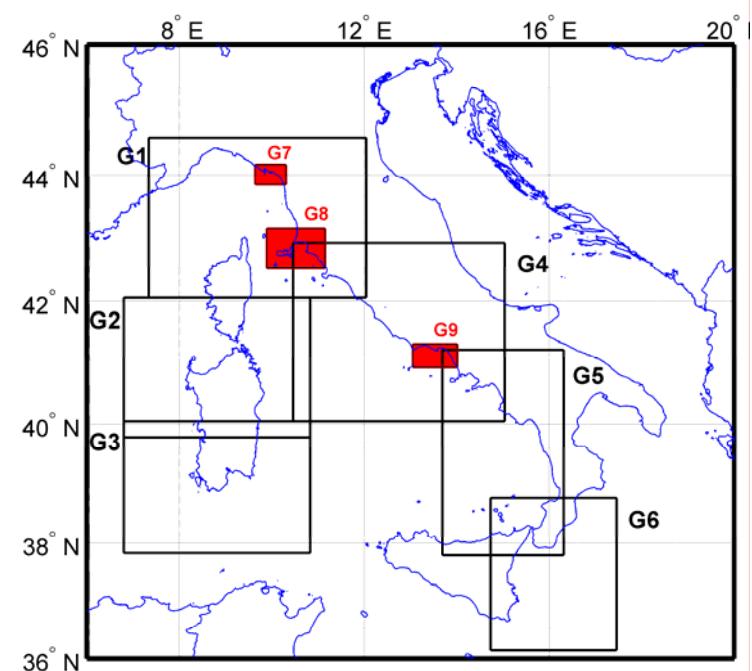

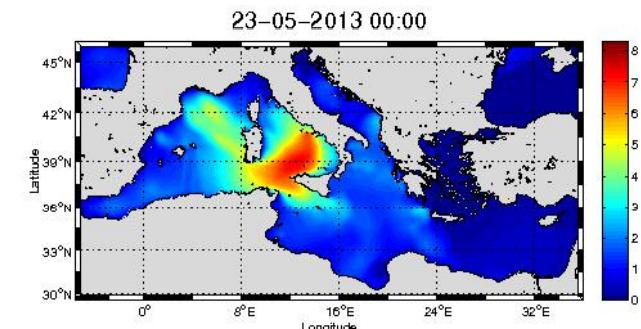

## MC\_WAF pre-operative stage: basic idea

- In order to realistically reproduce the propagation of waves in coastal areas a resolution of at least 400m is needed
- On the other hand fetches can be large, imposing boundary conditions on coastal areas can be problematic...
- There are significant advantages in simulating the whole Mediterranean Sea (i.e. satellite assimilation, no bc)

The idea is connect the Mediterranean scale with the coastal scale using an intermediate nesting at regional scale

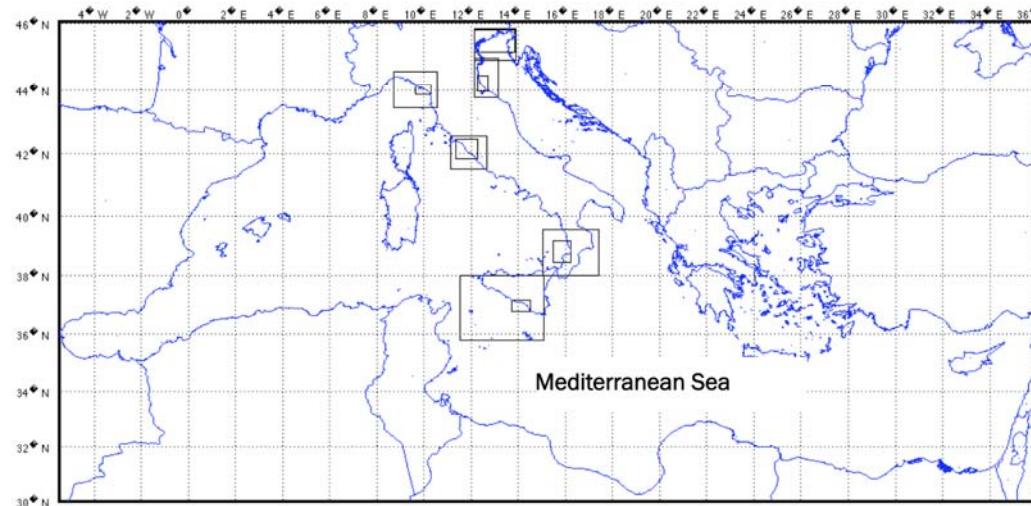

### MC\_WAF pre-operative stage:

Smooth nesting from Mediterranean scale to regional scale (nesting factor 1/2) and from regional to coastal scale (nesting factor 1/4)

### System assessment and fine tuning of the nesting procedures (2009-2011)

The system has been implemented and tested on more than 40 key studies in 6 regional areas along the Italian coasts

## *Marina di Carrara Buoy (Port Authority of Marina di Carrara)*

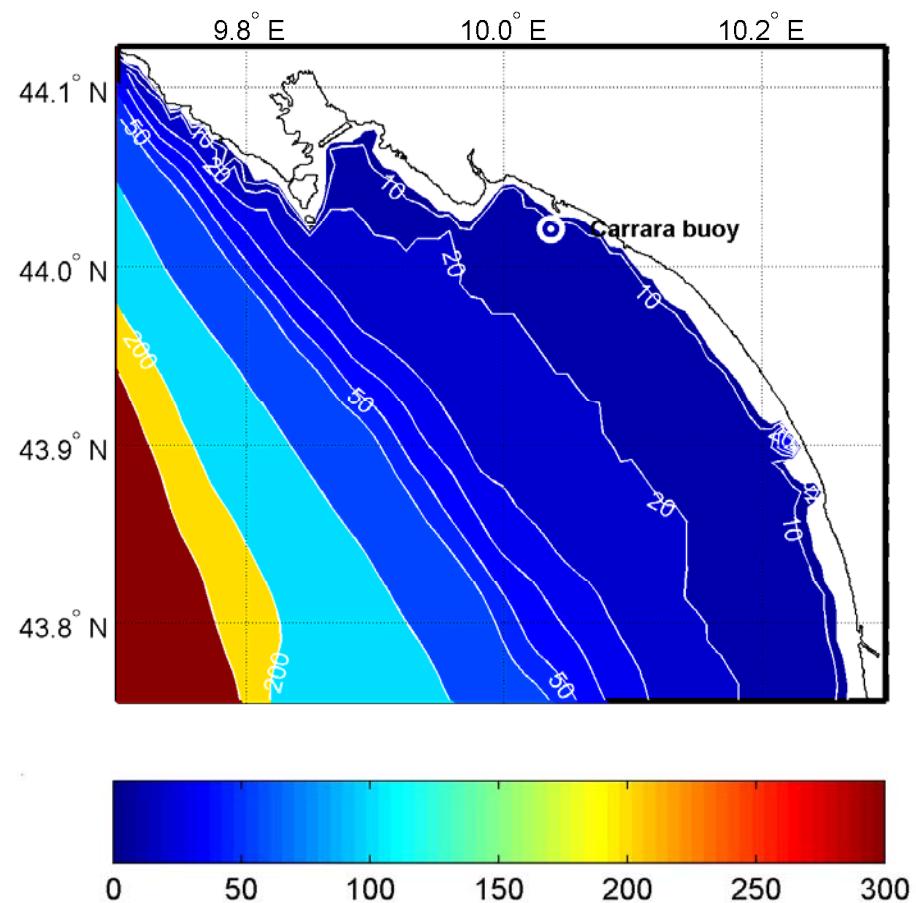

Directional buoy

Operative: since 2005

Mooring depth: 13.5 m

Geographic position:

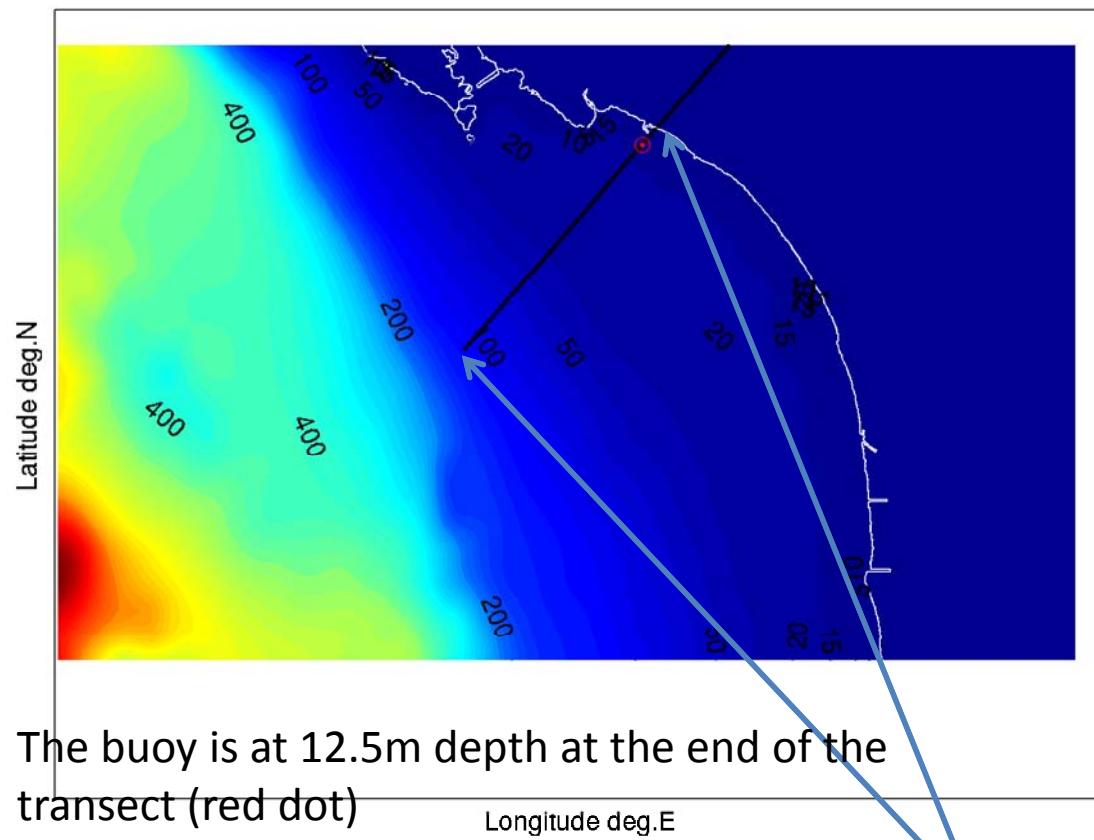

44,0214°N, 10,0361°E

## 'Fine tuning' of the system

direction= 230.335 date= 21-Mar-2008 21:00:00

Bathymetry and approximate track of the waves observed at the Carrara buoy on the 21 march 2008

The mean direction of the waves observed at the peak of the storm ( $H_m0=5.2\text{m}$ ) was approximately normal to the bathymetry

The data from a buoy in shallow water were kindly provided by the Carrara Port Authority

## Variation of Significant Wave Height and bathymetry along the transect

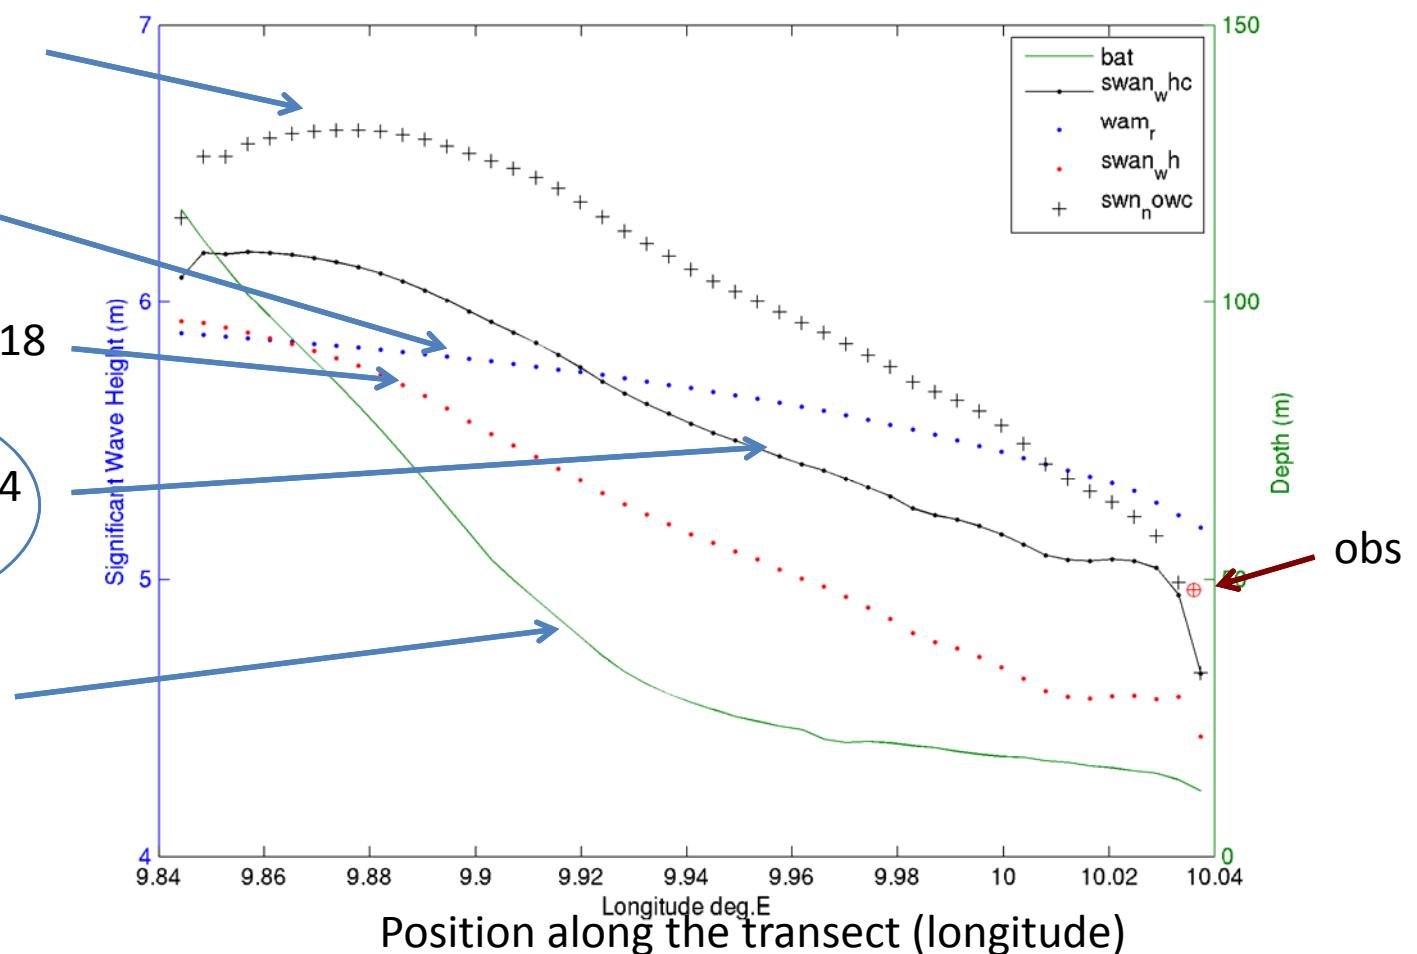

SWAN (Yan wind gen.  
no whitecapping)

WAM (Regional)

SWAN westh Br=0.0018

SWAN westh Br=0.004

Bathymetry along  
the transect

## saturation –based whitecapping

$$S_{ds,\text{break}}(\sigma, \theta) = -C'_{ds} \left( \frac{B(k)}{B_r} \right)^{p/2} (\tanh(kh))^{(2-p_0)/4} \sqrt{gk} E(\sigma, \theta)$$

$$B(k) = \int_0^{2\pi} k^4 \Phi(k, \theta) d\theta.$$

Van der Westhuysen (2007)

Banner et al. (2002)

$$B(k) = \int_0^{2\pi} c_g k^3 E(\sigma, \theta) d\theta$$

$$p = \frac{p_0}{2} + \frac{p_0}{2} \tanh \left[ 10 \left( \sqrt{\frac{B(k)}{B_r}} - 1 \right) \right]$$

$$p_0(\sigma) = 3 + \tanh \left[ w \left( \frac{u_*}{c} - 0.1 \right) \right]$$

When  $B(k) > B_r$ , waves break, and the exponent  $p$  is set equal to a constant calibration parameter  $p_0$ . For  $B(k) < B_r$  there is no breaking, and the dissipation based on  $B(k)$  gives way to other sources of dissipation by setting  $p$  to zero

Alves and Banner (2003)

## *Weatherforecastmodel BOLAM*

*HR-BOLAM (High Resolution BOLAM)*

Gridresolution: 30 km

*VHR-BOLAM (Very High Resolution BOLAM)*

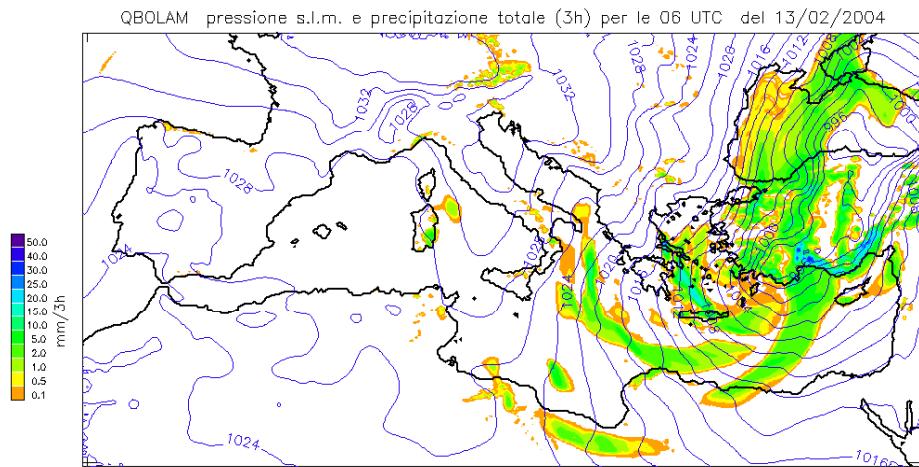

Nested on HR-BOLAM

Cover all the MediterraneanSea.

Gridresolution: 0.1 deg

Timestepoutput: 1hours

*3daysoperationalforecasts*

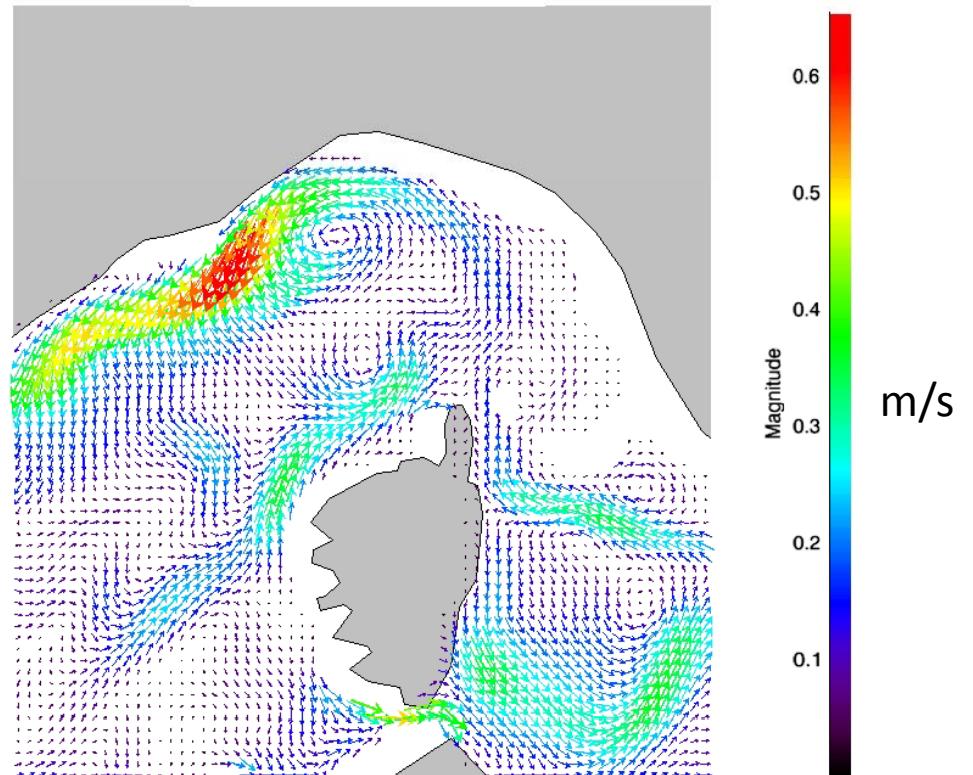

The use of a very high resolution non-hydrostatic model (MOLOCH) has been tested since september 2012  
5 km resolution wind will presumably introduced in regional areas in 2013

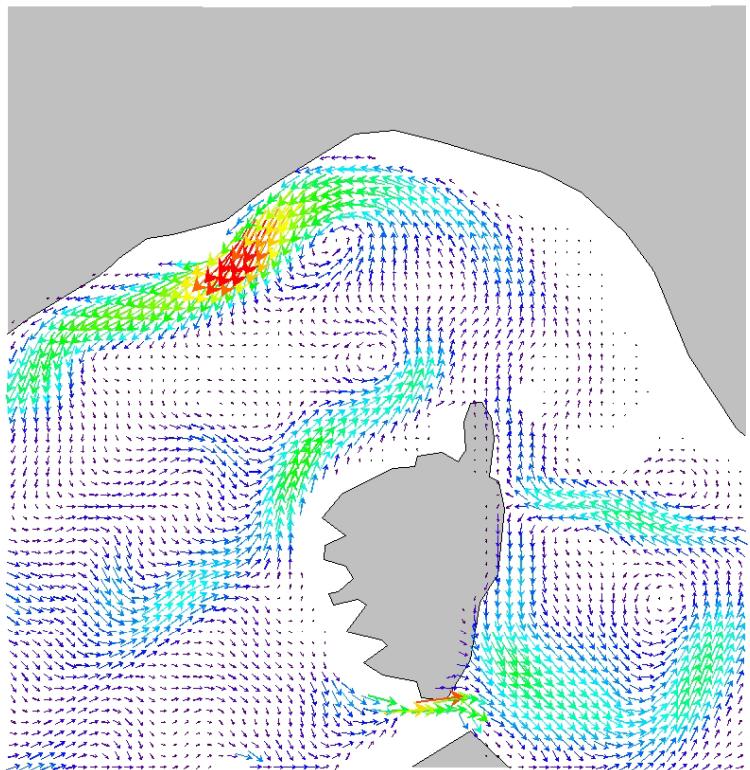

## Current Test:

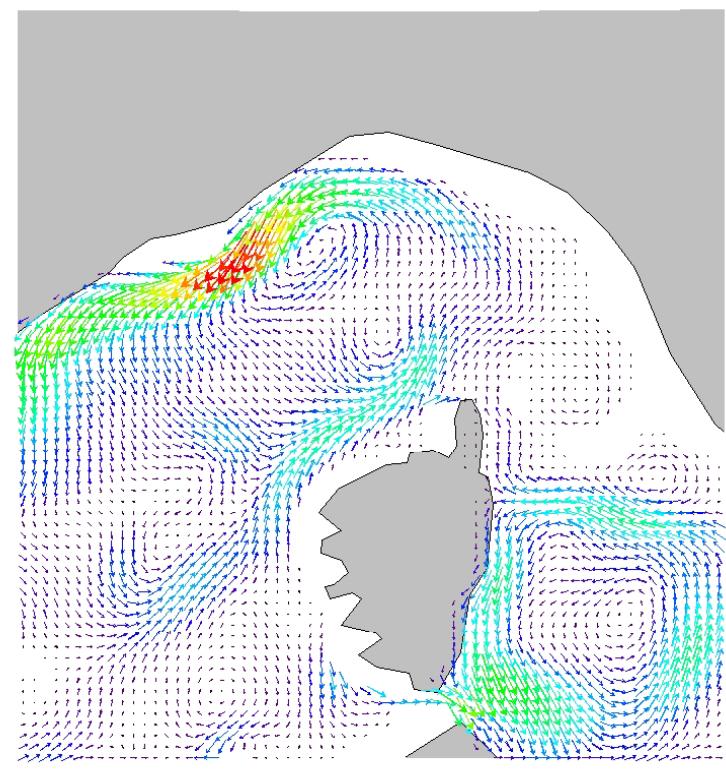

- currents were provided by the Mediterranean Forecasting System (INGV-Italy)
- resolution 1/16 deg.
- 10 days forecast fields/daily Analyses
- The fields cover all the Mediterranean Sea and are disseminated in the framework of MYOCEAN project
- Currents were used in the regional scale areas

current field at the surface: MFS analysis  
8 nov 2010

current field at the surface: MFS  
analysis 9 november 2010

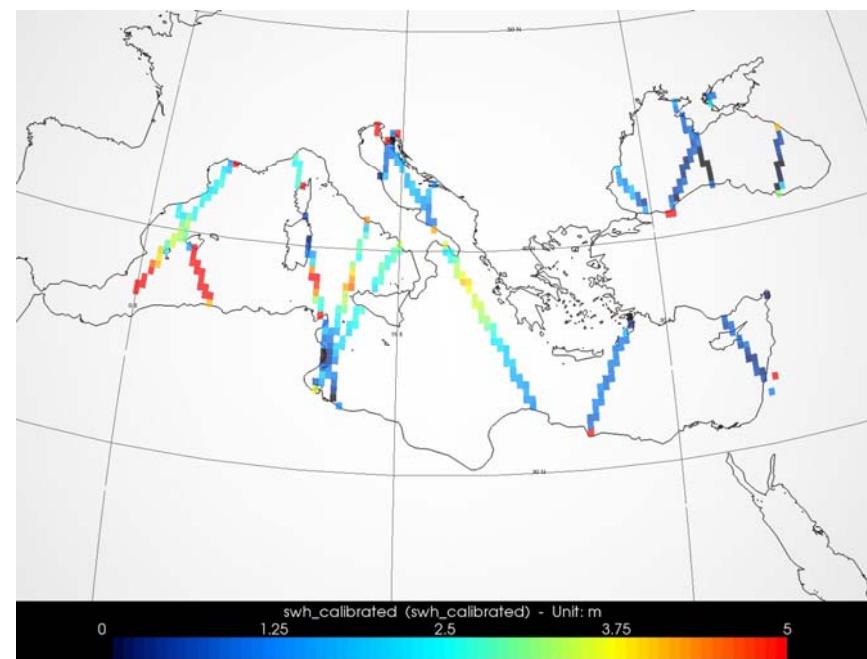

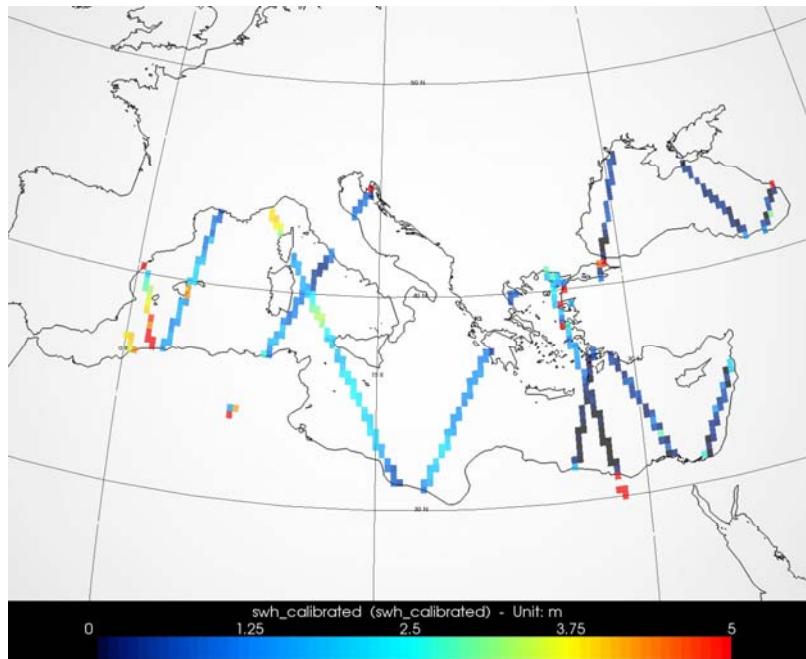

current field at the surface: MFS  
analysis 11 november 2010

the speed of the MFS current was averaged over the upper (40m) part of the Sea before being used in the regional WAM run

## Altimeter data assimilation test

Envisat, Jason-1 and Jason-2 significant wave height (swh) and surface wind data can be assimilated both in the Mediterranean scale model and in the regional scale. Generally there are 7-11 useful tracks every day.

With 1/30 deg resolution and a radius of influence of ~100 km the OI is not working properly: trivial error found in the original code.

## Carrara significant wave height (m)

## The Mediterranean Coastal Wave Forecast System (MC\_WAF) operational in July 2012:

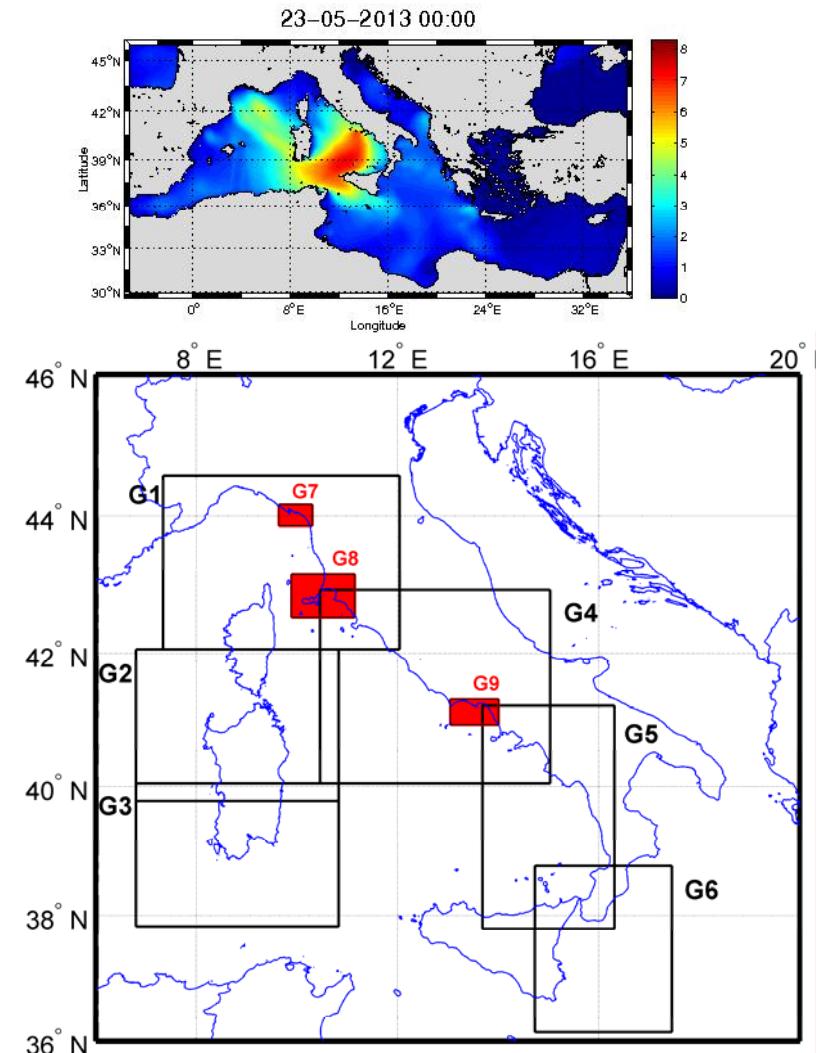

WAM cycle 4.5 grid covers the entire Mediterranean at 1/30 deg. res.

Nested in smaller regional scale areas at 1/60 deg. res. → 6 areas

Nested inside each regional area one (or more) coastal grids at 1/240 deg. res.: coastal model is SWAN cycle 2 (40.72)

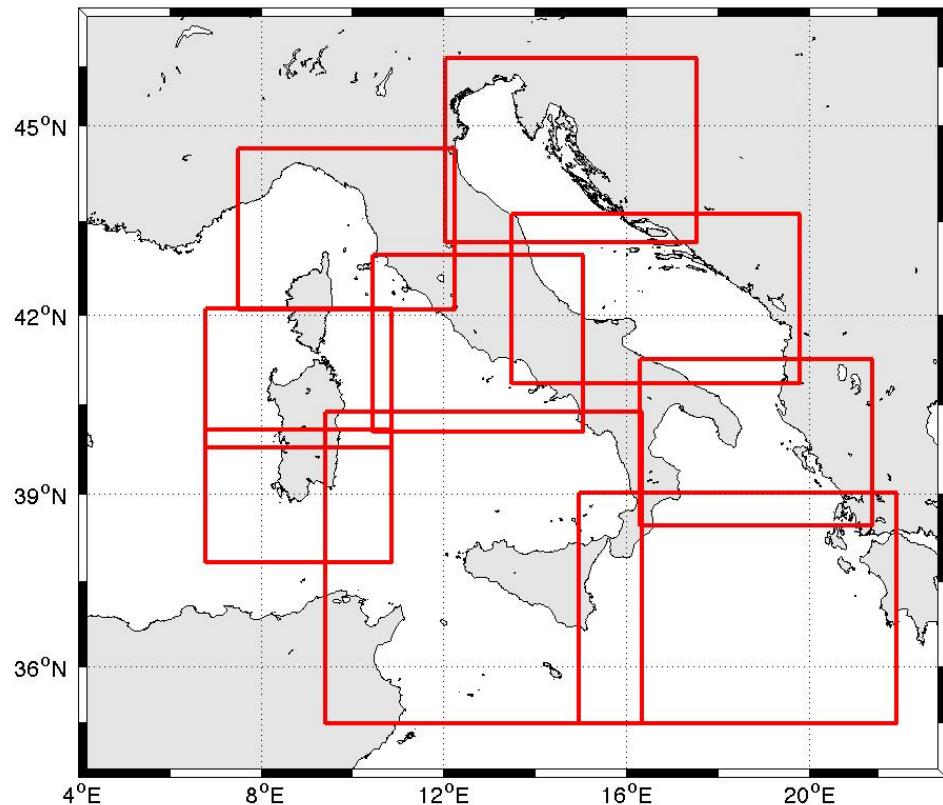

3 1/2 days operational forecast –every day (almost!)

WAM model cycle 4.5 (MPI version) has been made available by Heinz Gunther, GKSS

The Mediterranean Coastal Wave Forecast System (MC\_WAF)  
operational in June 2013:  
9 regional areas – 5 coastal areas:

Regional grids:  
Ligurian Sea –Northern Tyrrhenian Sea  
North Sardinia  
South sardinia  
Central Tyrrhenian Sea  
Southern Tyrrhenian/Sicily Channel  
Ionian Sea  
Otranto Channel/Gulf of Taranto  
Central Adriatic Sea  
Northern Adriatic Sea

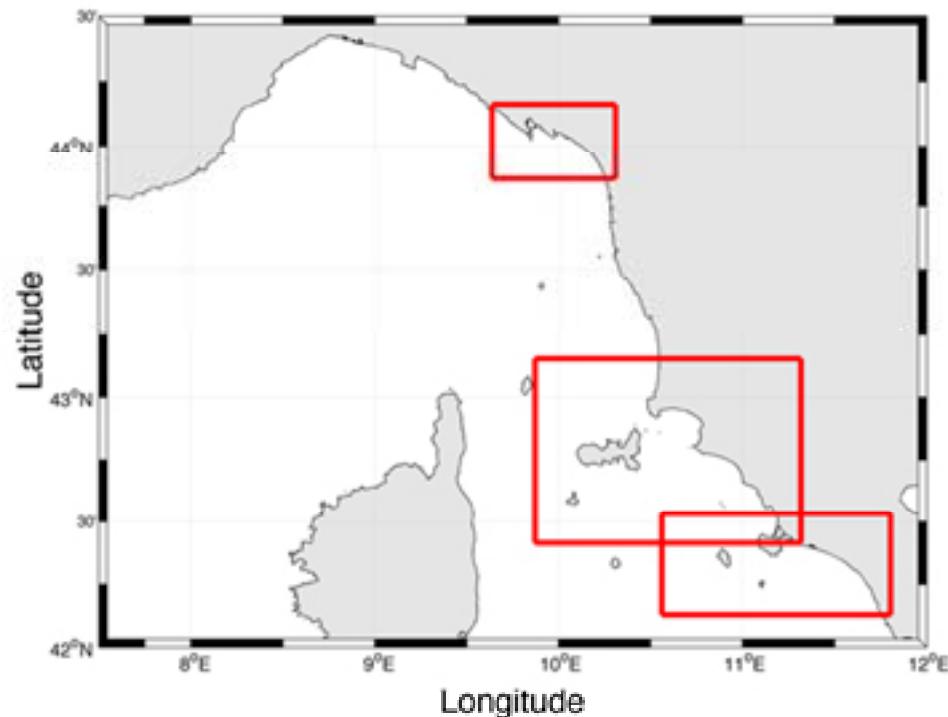

## Coastal Areas in the northern Tyrrhenian Sea- Ligurian Sea

Currently there are 5 operational coastal grids

-3 are nested in the WAM northern Tyrrhenian regional grid

Coastal Model : SWAN  
Resolution 1/240 deg. (~ 400 m)

Operational Costal grids:  
Carrara  
Isolad'Elba  
Isola del Giglio

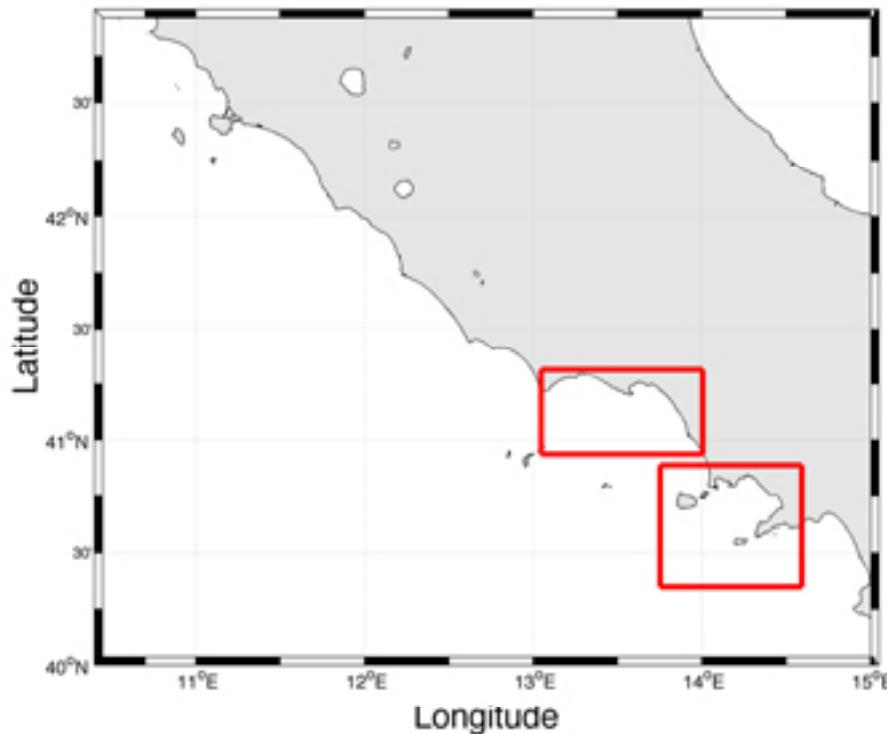

## Coastal grids in the central Tyrrhenian Sea

The 2 areas are nested in the central  
Tyrrhenian WAM regional grid

Model used : SWAN  
Resolution 1/240 deg. (~400 m)

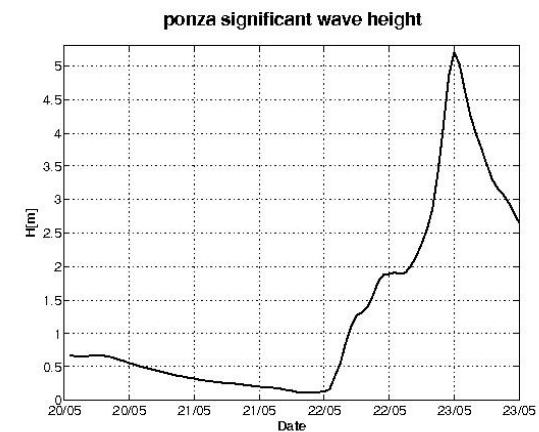

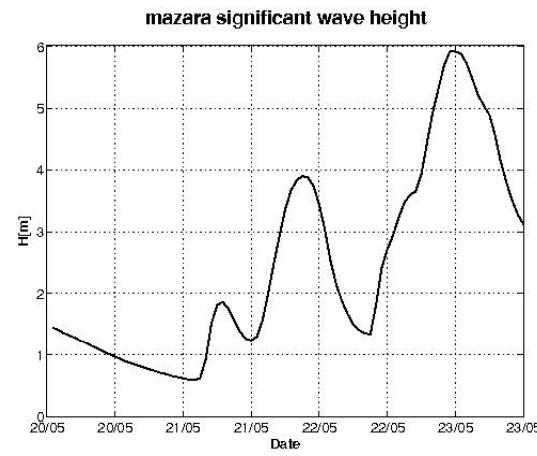

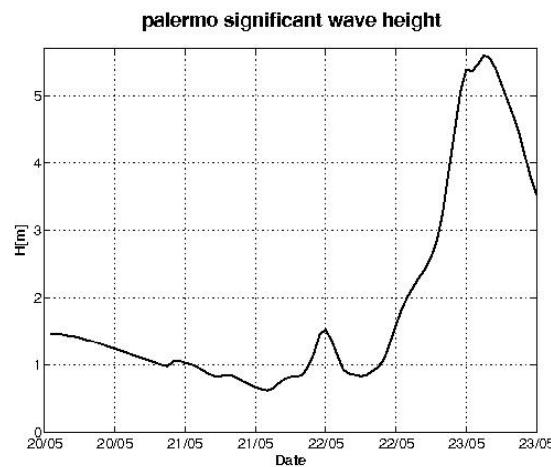

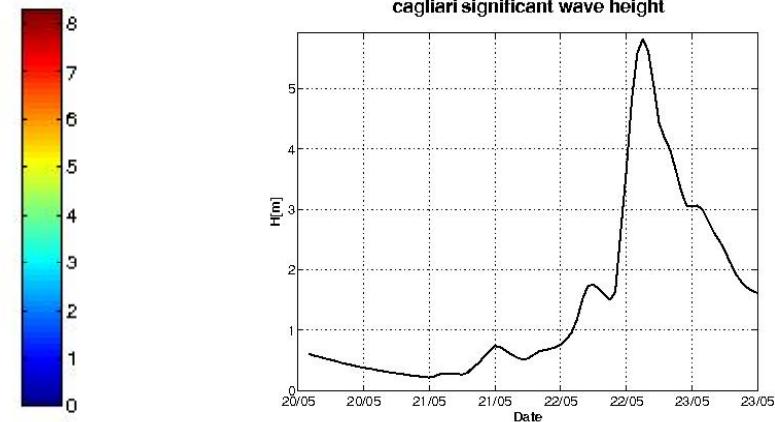

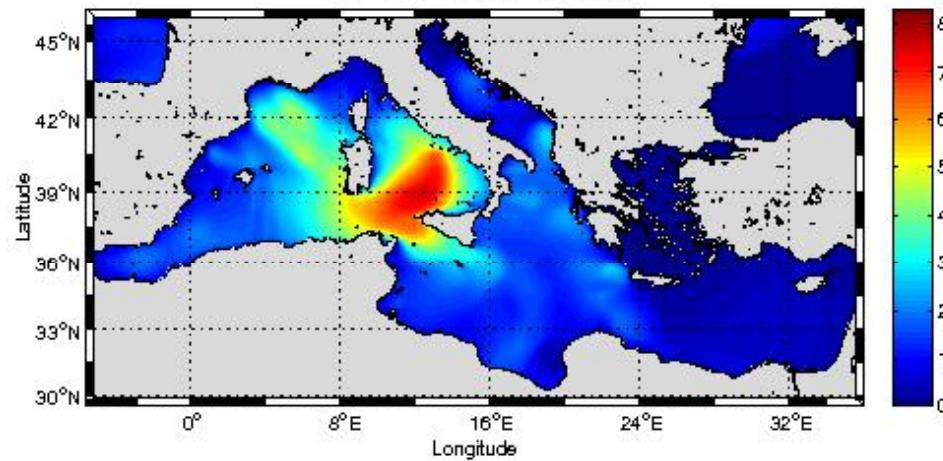

Operational coastal grids:  
Terracina  
Golfo di Napoli

## Forecast of the last significant event: 22-23 may 2013

## MC\_WAF next steps:

- Strenghten the system: the current link between meteorological system and coastal system too prone to small (but very disturbing) malfunctions
- Start using non-hydrostatic MOLOCH 5-km wind in regional and coastal areas before October 2013
- Start Testing currents in Sicily Channel regional grid before September
- start working at operational altimeter assimilation in Mediterranean and regional grids in 2014
